WEB GUARD

Complete Control of Internet Access

The WebGuard is a programmable internet timer that is designed to give parents control of their family's internet access via Dial-up or DSL modem. The compact, unobtrusive WebGuard is simple to use and installs easily between the computer modem and wall jack.

The programming is easy as setting an alarm clock—no software, no PC interface! Internet access schedules can be programmed differently for weekdays and weekends. The programming mode is accessible by password only and invalid attempts will result in a "lock-restriction" display. Even the jacks are tamper proof to prevent bypassing the device.

The WebGuard also Protects Business Computers from Unauthorized Access

Since the WebGuard stops unauthorized access from inbound and outbound calls, it is perfect for business applications. Now remote, isolated PC's will be safe from hackers but central offices can dial in at specific times for data retrieval. Again, there is no software or code that can be broken.   *...The perfect firewall!*

◆ *Schedule and Control Time and Length of Internet Use*

◆ *Prevents Unsupervised Internet Access*

◆ *User Friendly…No Software Required*

◆ *"User Defined" Password Protected*

◆ *Tamper-Proof Installation*

◆ *Non-Volatile Memory Preserves Programming in Power Outage*

◆ *Perfect Business Firewall!*

Finally...
Parents can really control internet use.

The WEBGUARD is Patent Pending
